

There are 0 High level security issues with our code. All issues discovered by the AUDIT SERVICE "MYTHx" are suggestive based and have been found to be none-severe or do not implicate any risk to the end user for interacting with our contract. Our reason for avoiding changes to the code are as follows, as they are coded like this on purpose and necessary for the contract to function as intended. All issues found below do not pose any risk and are coded this way for the following reasons:

(21) Medium: **Function could be marked as external:** We understand this but often reuses functions internally, so we set it as public.

(1) Medium: **Loop over unbounded data structure:** Only a limited amount of NFT will be supplied, capping potential gas limits from ever being reached. It's also not a loop.

(1) Low: **Floating Pragma is set:** Confirmed to work safely on all specified versions.

(19) Low: **Potential Use of Block.number:** Confirmed, there is no randomness in this contract. We need the block.number to create time for the contract distribution to work.

(2) Low: **Requirement Violation:** Nfts will be permanent never changing supply hence, will never be changed to create nested potential missed violations.

(3) Low: **Call with hardcoded Gas Amount:** There is no hard coded gas amounts used in the contract.

AS a result, we see it fit and safe to launch our code on the xDai blockchain.
